

A laptop is open in a dark room, displaying a code editor with syntax-highlighted code. The laptop is positioned in front of a window with horizontal blinds, through which some light is visible. The overall scene is dimly lit, with the laptop screen being the primary light source.

# CONCORD

*Interviewing Simplified*

Albin Kyle Myscich, Trevor Bolton, Mahmood Shilleh,  
Peiman Mohseni, Qusai Amer, Gowtham Batchala

# Three Tier Architecture

- *Presentation Tier*

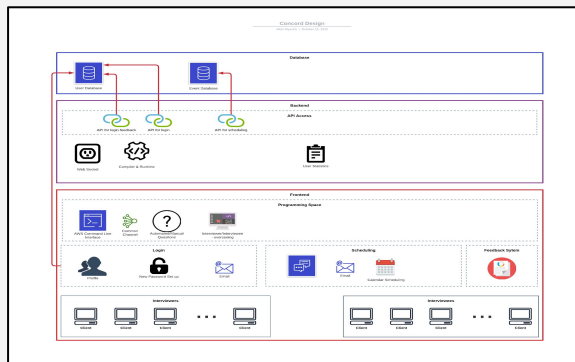

This tier is initially developed by the Lo-fi sketches based on the user stories. Our application uses React with Material UI to build this.

- *Logic Tier*

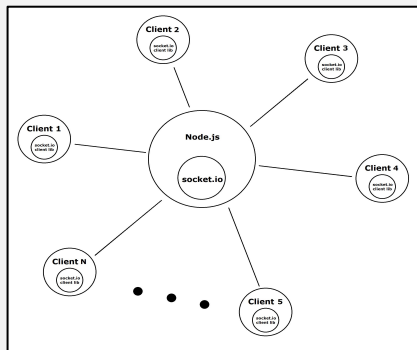

This tier contains all the logic to run all the application's capabilities. It is developed using Typescript and React.

- *Persistence Tier*

This tier comprises of the database and data access layer which move data to the logic tier. Concord uses a Postgres database that is run by GraphQL.

# Mockup Sketches

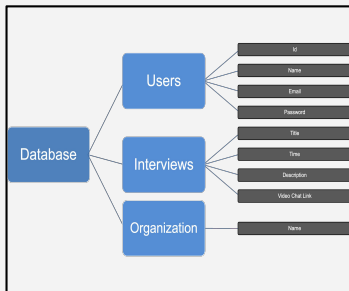

# Entity Design/DB Management

Concord uses a PostgreSQL database that is being managed by GraphQL API and TypeORM. Once all the queries and mutations are validated in the GraphQL Playground, they are utilized in the front-end via the Apollo Server. The main tables in the database include:

- **Users:** The users table consists of user-related information stored in the columns such as id, name, and email.
- **Events:** The interviews table include the title, time, and video link of the interview. It also contains relations with the users table that specify users that participate in this interview.
- **Organizations:** This table contains the name of the organization using Concord.

# Event Scheduling

## Calendar and Event Scheduling:

- *Past events*

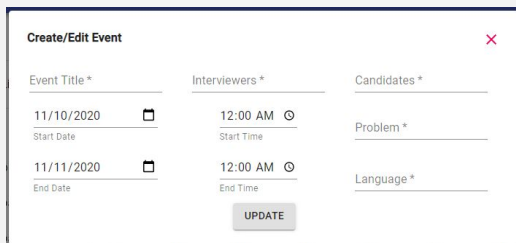

Keeps a register of the finished events.

- *Invite others*

The option allows the Interviewers and candidates to add their details.

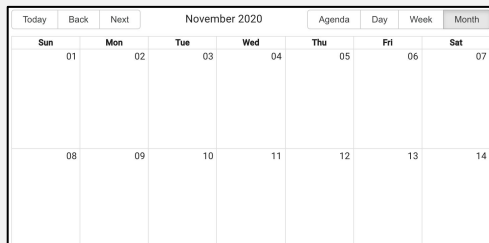

- *Add future events*

Event planning for feature coding sessions involving a specified: start and end dates/times, users, problem, language, and programming languages.

The 'Create/Edit Event' form is a web interface for scheduling events. It includes fields for 'Event Title \*', 'Interviewers \*', 'Candidates \*', 'Start Date' (with a calendar icon), 'Start Time' (with a clock icon), 'End Date' (with a calendar icon), 'End Time' (with a clock icon), 'Problem \*', and 'Language \*'. An 'UPDATE' button is located at the bottom right. A red 'X' icon is in the top right corner.

*Calendar Event Entry*

The 'Calendar Dashboard' displays a monthly calendar for November 2020. It includes navigation links for 'Today', 'Back', and 'Next'. The calendar grid shows days of the week (Sun, Mon, Tue, Wed, Thu, Fri, Sat) and dates (01 to 14). The calendar is currently set to 'November 2020' and has tabs for 'Agenda', 'Day', 'Week', and 'Month'.

*Calendar Dashboard*

# User Interactions

## User Interactions with Each Other:

- *Multi-User IDE*

Users doing a coding interview can view information in other ideas, whilst incorporating secure websockets.

## User Interactions with Concord:

- *Login/Signup*

Users can create an account and sign in.

- *Forgot Password*

Users can create a new password with a valid email if they forget theirs.

- *Settings*

Information can be viewed and edited in this modal.

- *Contact Us*

[Concordnoreply@gmail.com](mailto:Concordnoreply@gmail.com) can be contacted on the homepage regarding any feedback!

- *Home Page*

Shows general information about us and other miscellaneous things.

*Multi-User IDE*

*Home Page/Sign in*

*Setting Model*

# Testing and Validation

- **BDD and User Story Guidance**

BDD process was mostly done by Puppeteer, which is used for high level controlling of Chrome or Chromium.

- **SMART User Stories**

All of the user stories are relevant and comply with the characteristics of a SMART (Specific, Measurable, Achievable, Relevant, and Timeboxed). Here is an example of a story we write that is specific, achievable, and relevant.

Feature name: Future Meetings

As a general user

So that I can plan for future interviews or mock interviews

I want to see this information in a calendar tab

**Priority: High**

# Measuring the Agile Process

- **GitHub**

Concord project management is done using the GitHub project tool. This tool improves the structure of the software and makes it maintainable. It helps assign issues and keep track of the team's progress in our project. Once an issue is complete, it makes it really easy to review it and merge it to the master branch. The contribution of the team over time can be measured with this tool.

- **Pivotal Tracker**

Concord team also used Pivotal Tracker but was not as emphasized as GitHub; it was used for some user stories however.

# Customer Feedback

- **Feedback**

The customer provided a variety of suggestions including applying websocket safety and security measures, using Role-based access control (RBAC) and integrating hierarchical promotion of testing as per common practice. In addition, providing forgot password feature was suggested. The customer stressed the high priority IDE.

- **Improvements**

The IDE was implemented in this final iteration as suggested, as well as the forgot password feature. However, improvements can be made to the IDE such as a Chat Box, Split Screen IDE, and creating a join room to access a coding event.
